American Corn Saves Farmers And Skin

SAN FRANCISCO, CA (November, 1996) MM Manufacturing, a producer of environmentally friendly products has discovered how to achieve three major goals: reduce our reliance on petroleum, utilize the corn surplus and improve the company's flagship product.

"From day 1, almost fifteen years ago, I set out to develop environmentally friendly products because of my concern for workers' health and safety," explains founder, inventor and owner, Marianne Bennett. "My research indicates that our corn oil based **SavvySoap Waterless Hand Cleaner** is safer for users and the environment, has a minimum three year shelf life, works better, and does not have all the disadvantages of the toxic chemicals in use since World War II."

The growing industrial hygiene and safety company with its' invention of SavvySoap Waterless Hand & Brush Cleaner understands that corn oil is more a natural, readily available and renewable resource. The cleaner removes grime like ink, grease, and paint by rubbing it into skin and wiping with a cloth if water is not available. In electrical applications, material failure and death occur from using destructive compounds. SavvySoap ingredients not only pass industry specifications and standards, it is safer for not deteriorating worker's high voltage rubber gloves. The product is enjoying steady growth with the largest gas, electric, & water utilities, heavy construction and graphic arts industries.

Recently, with our U.S. FARM BILL, a trading partnership was developed with the USDA's Alternative Agricultural Research & Commercialization (AARC) Corporation and Marianne's small company. The company is being encouraged to find new ways of using agri-based materials. It also offers irritation blocking **SkinSafer** barrier cream, effective ES1 liquid gas leak detector, emergency spill response kits and other safety products.
